I'd like your opinion on this: In NextSeason, if the user has searched for a show and is looking at the show detail page, and they press the Search button in the toolbar, should they stay on the detail page or go back to the search page?

I'd make **Search return them to the search page.**

Reason: in your app, Search is a primary destination, not just a command. If the user is on a show detail page and taps **Search**, they are probably saying "I want to search for something else now," not "leave me where I am."

The cleanest behavior would be:

Search toolbar button → pop back to the Search screen, preserving:

- the existing search text
- the current search results
- scroll position if practical

That way the detail page still feels like a drill-in from Search, and the toolbar button behaves like navigation back to the Search section.

I would **not** clear the search automatically. Clearing should be a deliberate action, because the user may just want to compare another result from the same search.

That matches what I thought, thanks.

I think it's also the more consistent iOS behavior.

When you tap a tab or top-level navigation destination in many apps, you expect to be taken to that destination's root view, not to remain deep in a drill-down. A few examples:

- In Apple's **Mail**, tapping a mailbox takes you back to the message list rather than keeping you in a message.
- In **Settings**, selecting a different section takes you to that section's top level.
- Many third-party apps with tabs will pop to the root of the selected tab if you're deep in the navigation stack.

For **NextSeason**, your mental model is:

- **Search** → "I'm looking for shows."
- **Watchlist** → "I'm looking at my saved shows."

The detail view is a temporary drill-down from either of those places. So if the user explicitly chooses **Search**, it makes sense to return them to the Search screen.

One small thing I *wouldn't* do is throw away their work. Keeping the search query and results intact is a nice touch because it lets them quickly compare shows or pick a different result.

I also like that this behavior makes the app more predictable: every toolbar button always takes you to the screen named on the button. Beta testers rarely comment on predictable navigation—but they notice immediately when it behaves inconsistently.
